## data: data_age_decade_chf
## X-squared = 35.419, df = 7, p-value = 9.327e-06
```

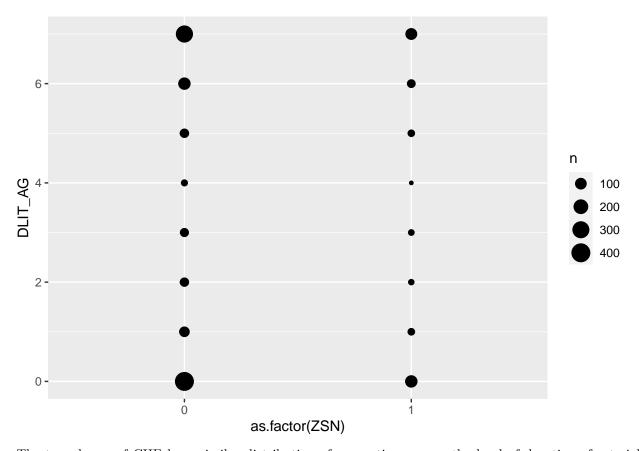

```
LR_data_age_decade_chf <- GTest(data_age_decade_chf)
LR_data_age_decade_chf

##
## Log likelihood ratio (G-test) test of independence without correction
##
## data: data_age_decade_chf
## G = 38.862, X-squared df = 7, p-value = 2.077e-06</pre>
```

Using the age by decade we have a p-value<0.01 which like the wilcoxon test suggest an association between age an chronic heart failure due to the rejection of the null

```

### Plot A

logistic regression model for CHF as explained by duration of arterial hypertension is not predictive. The predicted probabilities are effectively constant and the goodness of fit value is 0.0062618 suggesting we reject

In conclusion, the variable of duration of arterial hypertension by itself is not associated with the outcome of chronic heart failure. This ordinal variable was tested in the original form - with equally spaced categories - and was also evaluated with an adjustment of score assignment for the last two categories (that are not one-to-one mapping of name to value)

the null of the model fitting the data.

## [1] 0.7615942
The final model fitted: log \frac{\pi_i}{1-\pi_i} = -6.018 + 0.058 \times age + 0.073 \times I(IBS = 1) + 0.696 \times I(IBS = 2) + 0.726 \times age + 0.073 \times I(IBS = 1) + 0.096 \times I(IBS = 2) + 0.0726 \times age + 0.073 \times I(IBS = 1) + 0.096 \times I(IBS = 2) + 0.0726 \times age + 0.073 \times I(IBS = 1) + 0.096 \times I(IBS = 2) + 0.0726 \times age + 0.073 \times I(IBS = 1) + 0.096 \times I(IBS = 2) + 0.0726 \times age + 0.073 \times age +
I(SIM = 1) + 0.476 \times I(endocr01 = 1) + 1.081 \times I(endocr02 = 1). Hosmer Lemeshow tests shows adequate
goodness of fit (p = 0.4291).
